

QUESTION BANK 4

QUESTION BANK

4

CONCURRENCY

CERTIFICATION OBJECTIVES

- 4.1 Write code to define, instantiate, and start new threads using both `java.lang.Thread` and `java.lang.Runnable`.
- 4.2 Recognize the states in which a thread can exist, and identify ways in which a thread can transition from one state to another.
- 4.3 Given a scenario, write code that makes appropriate use of object locking to protect static or instance variables from concurrent access problems.
- 4.4 Given a scenario, write code that makes appropriate use of `wait`, `notify`, or `notifyAll`.

**QUESTION 4.1**

Q 1: Mr. John is working in XYZ Company Ltd. He tries to compile and execute the following program:

```
class SCJPQ10 {
    public static void main(String args[]) {
        SCJPQ10 scjp = new SCJPQ10();
        scjp.method1();
    }
    public void method1() {
        ThreadAsc tasc = new ThreadAsc("OneThread");
        tasc.start();
    }
}
class ThreadAsc extends Thread {
    private String str1 = " ";
    ThreadAsc(String s) {
        str1 = s;
    }
    public void run() {
        methodwait();
        System.out.println("Thread Completed");
    }
    public void methodwait() {
        while (true) {
            try {
                System.out.println("Waiting Thread");
                wait();
            } catch (InterruptedException e) {
            }
            System.out.println(str1);
        }
    }
}
```

What will happen when he compiles and executes the preceding program?

- A. The program displays "Waiting Thread" as an output.
- B. The program displays "Thread Completed" as an output.
- C. The program compiles successfully but an exception throws at runtime after displaying "Waiting Thread".
- D. The program generates compile-time error.
- E. The program displays "Waiting Thread" followed by "Thread Completed" as an output.

**QUESTION 4.2**

Q 2: Maria is working as a Java Programmer in XYZ Solutions. She tries to compile and execute the following program:

```
class SCJPQ20 implements Runnable {
    int k = 0;
    public SCJPQ20(int i) {
        this.k = i;
    }
    public static void main(String[] args)
    {
        new SCJPQ20(2).run();
        new SCJPQ20(1).run();
    }
    public void run() {
        for(int i=0; i<k; i++) {
            System.out.println("run() method...");
        }
    }
}
```

What will happen when she compiles and executes the preceding program?

- A. The program displays "run() method..." two times.
- B. The program displays "run() method..." as an output.

- The program displays "run() method..." three times.

C. The program creates two new threads.

Q 3: Assume that you are a Software Engineer and attempts to compile and execute the following program:

```
class SCJPQ25 extends Thread {
    SCJPQ25() {
        setPriority(5);
    }
    public void run() {
        System.out.println("Thread running");
    }
    public static void main(String args[]) {
        SCJPQ25 th1 = new SCJPQ25();
        SCJPQ25 th2 = new SCJPQ25();
        SCJPQ25 th3 = new SCJPQ25();
        th1.start();
        th2.start();
        th3.start();
    }
}
```

Which of the following statements are true about the preceding program?

- A. When the program runs, all three threads (th1, th2, and th3) executes concurrently, taking time-sliced turns in the CPU.
- B. The thread th1, and th2 executes but th3 never get the CPU.
- C. When the program runs, thread th1 executes first, then th2 executes and then th3 executes.
- D. None of the above options are true.

Q 4: Ramesh is working as a Java Developer in ABC Software Company Ltd. He tries to compile and execute the following program:

```
class ThreadTest extends Thread {
    String str = "";
    public ThreadTest(String s) {
        this.str = s;
    }
    public void run() {
        if(str.equals("thread1")) {
            yield();
        }
        System.out.println("End of " + str);
    }
    public static void main(String args []) {
        Thread thread1 = new ThreadTest("thread1");
        thread1.setPriority(Thread.MAX_PRIORITY);
        Thread thread2 = new ThreadTest("thread2");
        thread2.setPriority(Thread.MIN_PRIORITY);
        thread1.start(); thread2.start();
    }
}
```

What will happen when he compiles and executes the preceding program?

- A. The program displays "End of thread1" followed by "End of thread2" as an output.
- B. The program displays "End of thread1" and "End of thread2" in random order.
- C. The program generates exception at runtime.
- D. The program generates error at compile-time.

Q 5: Imagine that you are a Java Developer and attempts to compile and execute the following program:

```

class MyThread extends Thread {
    public void run() {
        System.out.println("Executing while loop");
        while(true){}
    }
} public class ThreadTest {
    public static void main(String args[]) throws Exception {
        MyThread thread1 = new MyThread();
        thread1.start();
        Thread.sleep(5000);
        thread1.interrupt();
    }
}

```

Which of the following statements are correct about the preceding program?

- A. The program executes and will never end. B. The program generates compiler-time error.
 C. The program generates runtime exception. D. None of the above options are correct.
 the program executes successfully but it will never end.

Q 6: Which of the following methods are used to pass a timeout argument?

- A. wait() B. yield() C. start() D. join()
 E. notify() F. notifyAll() G. run() H. sleep()

Q 7: Imagine that you are a Java Developer and attempts to compile and execute the following program:

```

class DeadlockTest
{
    static StringBuffer s1 = new StringBuffer();
    static StringBuffer s2 = new StringBuffer();
    public static void main(String[] args) {
        new Thread (
            new Runnable() {
                public void run() {
                    synchronized(s1) {
                        s1.append("A");
                    }
                    synchronized(s2) {
                        s2.append("B");
                    }
                }
            }
        ).start();
        new Thread
        (
            new Runnable() {
                public void run() {
                    synchronized(s2) {
                        s1.append("B");
                    }
                    synchronized(s1) {
                        s2.append("A");
                    }
                }
            }
        ).start();
    }
}

```

At which line is a compile-time error generated?

- A. Statement at //1
- B. Statement at //2
- C. Statement at //3
- D. None of the above

QUESTION 4.10

Q 10: Assume that you are a Java Developer in XYZ Software Solution and tries to compile and run the following thread program:

```
class ThreadClass implements Runnable {
    public void run() {
        System.out.println("Running thread...");
    }
}
class Test {
    public static void main(String args[]) throws Exception {
        Thread thread1 = new Thread();
        Thread thread2 = new Thread(new ThreadClass());
        Thread thread3 = new Thread(new ThreadClass(), "Thread3");
        Thread thread4 = new Thread("Thread4");
        Thread thread5 = new Thread("Thread5", 5); //1
        Thread thread6 = new Thread("Thread6", new MyClass()); //2
    }
}
```

What happen when you compile and run the preceding program?

- A. Program generates compilation error at //1
- B. Program generates compilation error at //2
- C. Program generates runtime error
- D. Program compiles successfully and displays Running thread...

QUESTION 4.11

Q 11: Jude during her training session was asked to create a program extending the Thread class to implement threading concept. Jude created the following program:

```
class Jude extends Thread {
    public void run() {
        for(int i=0;i<2;i++) {
            System.out.print("Hello"+" ");
        }
        txt("Java");
    }
    public void txt(String str) {
        String s=str;
        System.out.print(s);
    }
    public static void main(String args[]) {
        Jude thrd=new Jude();
        thrd.start();
    }
}
```

What will be the output of this program?

- A. The program will generate compile time error
- B. The program will display Java Hello Hello as output.
- C. The program will display Hello Hello Java as output.
- D. The program will display Hello Hello as output.

QUESTION 4.12

Q 12: Jane and Sam, while preparing for the SCJP exam, came across the following program:

```
class Jude implements Runnable {
    static Thread t;
    public void run() {
        try{
            for(int i=0;i<3-1;i=i+2, i--) {
                System.out.println("Hello");
                t.sleep(1500);
            }
        }catch(InterruptedException ie) {
            ie.printStackTrace();
        }
    }
    public static void main(String ar[]) {
        Jude jd=new Jude();
        t = new Thread(jd);
        t.start();
    }
}
```

What will be the output of this program?

- A. The program displays Hello followed by Hello with a pause of 1500 milliseconds.
- B. The program displays Hello Hello Hello.
- C. The program will compilation error.
- D. Program will successfully compile and execute without displaying any value.

Q 13: Rose works as a developer in XYZ Company and she created the following program:

```
class Test implements Runnable {
    static Thread t1, t2;
    public void run() {
        for(int i=0; ;){
            System.out.println(Thread.currentThread().getName());
            i++;
        }
    }
    public static void main(String ar[]) {
        Test t=new Test();
        t1=new Thread(t, "T1");
        t2=new Thread(t, "T2");
        try{ t1.start();
            t1.sleep(5000);
        }catch(Exception e){ }
        t2.start();
    }
}
```

What will be the output of this program?

- A. The program will cause compilation error.
- B. Program will execute in an infinite loop and display T1 and T2 depending on their time slice.
- C. T2 will not be displayed because the t1.start() first invokes the run() method and therefore T2 will not be displayed
- D. The program will throw runtime exception.

Q 14: Jude works as a developer in XYZ Company and during a project she created the following program:

```
class Test implements Runnable {
    static Thread t1;
    public void run() {
        for(int i=0; i<2;i++){
            System.out.print("Hello"+" ");
        }
    }
    public static void main(String args[]) {
        Test t=new Test();
        t1=new Thread(t);
        t1.run();
    }
}
```

What will be the output of the preceding program?

- A. The program will display Hello Hello as output.
- B. Program will not compile successfully because run() method is being explicitly called.
- C. The run() method that will execute in this program, is of Runnable interface.
- D. Program will successfully compile and execute but does not display any value.

QUESTION 4.15

Q 15: Rose while working on a project in XYZ Company created the following program:

```
class Test implements Runnable {
    static Thread t1, t2;
    public void run() {
        synchronized(this){
            try{
                for(int i=1; i<=5;i++){
                    System.out.println(i);
                    t2.wait();
                }
            }catch(Exception e) { }
        }
    }
    public static void main(String ar[])
    {
        Test t=new Test();
        t1=new Thread(t);
        t2=new Thread(t);
        t1.start();
        t1.start();
    }
}
```

What will be the output of the preceding program?

- A. The program generates compilation error because the start() method is called twice on the same object.
- B. The program throws runtime exception because the start() method is called twice on the same object.
- C. The program displays 1 followed by runtime exception.
- D. The program displays 1 2 3 4 5 as output.

QUESTION 4.16

Q 16: Rose during her training session was shown the following program:

```
class Rose implements Runnable {
    public void run() {
        System.out.println(" Hello");
    }
    public static void main(String ar[]) {
        Rose thrd=new Rose ();
        Thread T=new Thread(thrd);
        T.run();
    }
}
```

What will be the output of the preceding program?

- A. The program will display Hello as output.
- B. The program will generate compilation error because start() method is not invoked therefore run() method can also not be invoked.
- C. The program will throw runtime exception because start() method is not invoked therefore run() method can also not be invoked.
- D. Program will compile and execute successfully but nothing will be displayed as output.

QUESTION 4.17

Q 17: Assume that you are a Java Developer in ABC Software Solution and tries to compile and run the following thread program:

```
class ThreadTest extends Thread {
    public void run() {
        System.out.println("Starting thread");
        try {
            Thread.sleep(1000);
            System.out.println("Time is up");
        } catch (InterruptedException ex) {
            System.out.println("Interrupted" +ex);
        }
    }
}
class Test1
{
    public static void main(String args[])
    {
        ThreadTest t1 = new ThreadTest();
        ThreadTest t2 = new ThreadTest();
        t1.start();
        t2.start();
    }
}
```

What happen when you compile and run the preceding program?

- A. Program displays "Starting thread" 2 times and after 1 seconds, it displays "Time is up" 2 times.
- B. Program does not display any output
- C. Program generates compilation error
- D. Program generates runtime error.

Q 18: Imagine you are working in ABC Company as a Java programmer and have written the following program:

```
public class Concur1 {
    public static void main(String ar[]) {
        MyThread mthread = new MyThread();
        mthread.start();
    }
}
class ThreadDemo implements Runnable {
    public void run() {
        System.out.println("Thread Demo");
    }
}
class MyThread extends Thread {
    public void start(){
        System.out.println("My Thread");
    }
    public void run() {
        Thread thrd = new Thread(new ThreadDemo());
        thrd.start();
    }
}
```

What is the result when you compile and execute this program?

- A. The program compiles without error and displays My Thread as output.
- B. The program compiles without error and displays My Thread and Thread Demo as output.
- C. The program compiles without error and displays Thread Demo as output.
- D. The program generates compilation error because of overridden start() method.

Q 19: Imagine you are working as a Java programmer in ABC Company and have written the following program:

```
public class Concur2 {
    public static void main(String ar[]) {
        Thread inactthrd = new Thread(new ThreadInactiveDemo());
        inactthrd.start();
        Thread actthrd = new Thread(new ThreadActiveDemo());
        actthrd.start();
    }
}
class ThreadActiveDemo implements Runnable {
    public void run() {
        System.out.println("Thread - Active Demo");
    }
}
class ThreadInactiveDemo implements Runnable {
    public void run() {
```

```

        try {
            Thread.sleep(4 * 1000);
        } catch (InterruptedException E) {
            E.printStackTrace();
        }
        System.out.println("Thread - Inactive Demo");
    }
}

```

What will be the result when you compile and execute this program?

- A. The program compiles without error and displays Thread – Inactive Demo, takes pause and then displays Thread – Active Demo.
- B. The program generates compilation error.
- C. The program compiles without error and displays Thread – Active Demo, takes pause and then displays Thread – Inactive Demo.
- D. Different output will be shown in multiple executions.

Q 20: Imagine you are a Java programmer in ABC Company and you have written the following code

```

public class Concur3 {
    public static void main(String ar[]) {
        MyThread thrd = new MyThread();
        thrd.start();
    }
}
class MyThread extends Thread {
    public void run() {
        for (int var=1; var<6 ; var++) {
            if (Thread.interrupted()) {
                System.out.println("The interrupt() Method Invoked");
            }
            if (var == 3 || var == 5) {
                this.interrupt();
            }
        }
    }
}
}

```

What is the result when you compile and execute this program?

- A. It shows a compile time error.
- B. It throws InterruptedException at runtime.
- C. It compiles without error and does not display any output.
- D. It compiles without error and displays The interrupt() Method Invoked as output.

QUESTION 4.21

Q 21: Imagine you are a Java programmer of ABC Company and have written the following code

```

public class Concur6 {
    public static void main(String ar[]) throws InterruptedException {
        System.out.println("The main() method");
    }
}

```

```

        DaemonThreadDemo thrd = new DaemonThreadDemo();
        thrd.start();
        thrd.join();
        System.out.println(thrd.isAlive());
    }
}
class DaemonThreadDemo extends Thread {
    public DaemonThreadDemo() {
        setDaemon(true);
    }
    public void run() {
        System.out.println("The run() method");
    }
}

```

What is the result of the program when you compile and execute it?

- A. The program displays The run() method, The main() method and false as output.
- B. The program displays The run() method, The main() method and true as output.
- C. The program displays The main() method, The run() method and false as output.**
- D. The program displays The main() method, The run() method and true as output.

Q 22: Imagine you are working in ABC Company as Java programmer and have written following code:

```

public class Concur7 {
    public static void main(String ar[]) throws InterruptedException {
        String str1 = new String("R1");
        String str2 = new String("R2");
        MyThread thrd1 = new MyThread("Firsr", str1, str2);
        MyThread thrd2 = new MyThread("Second", str1, str2);
        thrd1.start();
        thrd1.join();
        thrd2.start();
    }
}
class MyThread extends Thread {
    private String First;
    private String Second;
    public MyThread(String thrdname, String one, String two) {
        super(thrdname);
        First = one;
        Second = two;
    }
    public void run() {
        if (getName().equals("First")) {
            synchronized (First) {
                try {
                    Thread.sleep(4000);
                } catch (InterruptedException E) {
                    E.printStackTrace();
                }
            }
            synchronized (Second) {}
        }
        else {
            synchronized (Second) {
                try {
                    Thread.sleep(4000);
                } catch (InterruptedException E) {
                    E.printStackTrace();
                }
            }
            synchronized (First) {}
        }
    }
}

```

What will be the result when you compile and execute the preceding code?

- A. The program generates compilation error.
- B. The program compiles without error but throws runtime exception.
- C. The program compiles without error but deadlock occurs at runtime.
- D. The program compiles and executes without any error or deadlock

Q 23: Imagine as a Java programmer you have written the following code to implement the wait() and notifyAll() methods.

```
public class Concur8 {  
    public static void main(String ar[]) throws InterruptedException {  
        Thread thrd2 = new Thread("thrd2");  
        synchronized (Concur8.class) {  
            thrd2.wait();  
        }  
        Thread thrd1 = new Thread("thrd1");  
        synchronized (thrd1) {  
            thrd1.wait();  
            thrd1.notifyAll();  
        }  
    }  
}
```

What is the result when you compile and execute the program?

- A. The program compiles without error but throws IllegalMonitorStateException exception on thread t2 at runtime.
- B. The program generates compilation error.
- C. The program compiles without error and executes in an infinite loop.
- D. The program compiles without error but throws InterruptedException exception at runtime.
